

## ABSTRACT

An electronic apparatus that transmits error information about setting of a block size to a host device without making a design of the host device complicated and  
5 a control method thereof, are provided.

The electronic apparatus of the present invention has:  
an interface section that transmits/receives a command, a  
response and data to/from the host device and when the data  
is a predetermined length or more, executes multi-block  
10 transmission; a data buffer; and a storage section that  
stores information about a block size, wherein when the  
interface section receives a block size setting command  
transmitted from the host device and the block size is  
larger than a capacity of the data buffer, it transmits a  
15 response including error information about incapability of  
accepting the block size at the time which has a  
predetermined relation to the block size setting command.
